NEW MEX CO; Socorro Co.;
SEVILLETA NW R
1989 - - Packed on Bluff and walked towards Southern border of Sevilleta - Picked up an Odocoileus Skull (poached ?), the soil was extremely sandy with very few grasses. (Sage & Skeleton brush), Other hayo Siderooperus ad Crotalus atro (western diamondback).
Drove back to Refuge Headquarters unloaded picked up Manuel Molles, Tad Cracker, and Enrique. Plynesia also seen at this locality.

Gopher survey:

- Tracks sighted near Rio Grande R. & HWY 66 along La Joya Game Res., especially large ones possibly Papageonia likely to be T. bottae.
- Mounds present yet scarce along the Road between MacKenzie Flats and Nuevo Flats.
- South of Sepulveda Canyon Many mounds were sighted west of the Road into MacKenzie Flats around the tip and and along the bluff N./, especially abundant along this road (N. 2 mi.) all the way to Spts.
- More mounds sighted 1 mi. W of Spts. quilted towards Contrelas,
- Gopher Tracks were sighted S. of Bernando, to the Refuge H.Q. presumably T. bottae.
- No gophers sign were sighted Nega the Rest Area on I-25, nor many alfalfa fields, but that needs to be examined fully - personal contact,
NEWMEXICO; Socorro Co; Sevilleta NWR
17 May 1989 -- mileage 4097.8 left ABO at 0730h.
arrived at Sevilleta HQ 0816h. mileage 4167.8.
Brought Eduardo Palma and 1st load of LTER Lab gear.
It was rainy most of the day (morning) and cool.
Vertebrate crew attempted to finish placing pitfalls
in Sepultura Canyon because of thunder and lightning.
we went to glandland grids instead 1230h.
finished placing traps on 3 grids saw no herps.
These grids were north of the road that was just west
of 5 pts. about 2 miles west from 5pts. Headed back
to HQ about 1730h. As we traveled N of 5pts
saw a box turtle Terrapene (2mi. N) Filled 3/4
full with gas (LTER Site) Returned to ABO 2015h.
mileage 4230.1. (Total hours - 101/2h)

22 May 1989 -- The 1st day of vertebrate sampling,
left ABO with Randy Jennings at 1000h. Loaded
Lab gear up with other trucks at 0730h. arrived
@ HQ ~ 1045h. Began setting up lab cars and
shit everywhere. Finished cleaning up and prepping
lab by 1500h. Saw a checked whiptail Chrysemys
rigis. Crews Yates and Cannon arrived by 1700h,
and assisted in Lab organization.
NEW MEXICO: Seco Co.; Sevilleta NWR
23 May 1984 -- woke at 0500h. Last night was cool with
light breezy and about a 3/4 moon. Went to the Pinyon/Janiper grids with Terry and 5 others @ 0530h. Returned
had to hike to the top of the Mesa in Sevilleta Canyon to check 3 of the grids (one removed and
& Mark + Recapture). One grid the removal got 5
animals ( ). Saw
one Oreomystes. 90% of these trap sites were
set in areas unproductive (unkued areas, backwards
on mouse runs, too much bait, not sensitive enough)
Because of this several assumptions of density
estimates of grids in that if there is a mammal
at each of these stations the trap will get it.
0930h went to check the other removal grid
north of these in the canyon. Got 3 ( ) and 1 hop (Oreomystes)
The traps were in about the same conditions as those
on the Mesa. Returned to Trucks waited here for
1 1/2 h. as waiting saw a Eugeniaia, minning
very short, light buffy sides. Headed back
to HQ @ 1100h.

Began processing animals at 1230h. Finished
at 1500h. The other Mammal crews headed back
to ABQ. Went to bed about 0300h. (10h)
NEW MEXICO: Second Co; Scullces NW R

29 May 1989 -- woke @ 05:30h. Last night was rather breezy out of SW, chilly <65°F, and overcast for most of the night and the moon was 1/2 full. J. Frey, J. D. Moore and I left for the Renewal grids @ 0530h. On our way to Sepulcrea Canyon we saw a Black Bear near the Big Well at Northeastern part of Mackenzie Flat. It was heading South but turned around and headed to the Los Pilares. It was a small bear, presumably a young bear. Continued to Sepulcrea Canyon stopped at the entrance and picked up a side with the others. I checked the higher grid and Frey & Moore checked the lower. On my grid I saw a Sylvilagus audoboni and 7 Odocoileus hemionus, also one of them was found on W2 grid. Two Cenocophaga were sighted. — were collected on this grid ( ). The pitfalls were probably unsuccessful for a number of reasons (Cans only one deep, often the lips of the cans were 1-2" above the ground, the shade tin was often placed directly over the can forming a lid, drift fences entirely inadequate, and 1 set of 40m pitfalls were not in place). The traps were set in better locations but were baited heavily, without greater sensitivity, also traps from the previous days were not replaced. Returned to the truck and drove back 0945h. West of the Big Well Sighted 3 Antilocapra (1cown, 2adulls)
NEW MEXICO: Socorro Co.; Sevilleta NWR

24 May 1989 -- These Anoles appeared to ride the truck apparently sensing that if out run they would be decapitated or blocked in. They appeared to exhibit great control over their speed and sexual dimorphism in their ambulation. The larger one was traveling at better than 45 mph with its legs parallel to the ground, The young one preferred to stay back. Returned by 11:45h, ate lunch and began processing animals and finished by 6:00h. Processed some of the ethylene glycolated animals. Left for the Caribou at San Antonio at 1900h, bed at 2315h.

25 May 1989 -- Woke @ 0520h, left for Sepulveda Canyon. Checked grid on the Mesa. Last night the temperature was a bit cooler @ 60°F. Collected two peromyscus canadensis, one large centipede. *Again traps were not replaced there was extremely amounts of bait in the traps, and they weren't very sensitive*; Saw one Speothos auduboni on grid W2 and 5 Cnemidophorus (striped whiptails)

Returned to truck by 0915h, Saw one checked whiptail. Headed back to Hq. Picked up a Phrynosoma? DCR on the road South of Big Well. 1/2 mi., Began processing animals at 1100h, kenotyping and pulling tissue finished by 1430h.
